**‘one of the many tools we have to help us build your system solution’**

### ***HERON-FPGA7 FPGA module with SDRAM and Digital I/O***

- **Xilinx Virtex II FPGA with 3, 6 or 8M gates.**
- **256Mbytes of SDRAM connected as 64Mx32 @133Mhz**
- **FPGA configuration downloaded using the HERON Serial Bus.**
- **Choice of clocking options**
- **45 user defined Digital I/Os**
- **1 channel of RS232/RS485**
- **Connects to all of the HERON FIFOs, UMI and module ID signals**
- **Flash PROM for storage of configuration data (not yet available from Xilinx)**

The HERON-FPGA7 provides a user programmable FPGA element for a HERON system combined with a bank of SDRAM capable of more than 500Mbytes/second. This can be used to process data flows or as a flexible digital I/O module.

Using the HERON serial bus allows the FPGA to be configured with a standard module configuration, or a custom one provided by the user, or HUNT ENGINEERING. After configuration the module can accept user messages over the HERON serial bus allowing registers etc to be programmed. If a more significant programming change is required a complete new FPGA configuration can be downloaded. The FLASH based configuration PROM can load the configuration data into the FPGA when it is used in an embedded system. This PROM can be programmed using the standard JTAG cable available from Xilinx (such as Xilinx Parallel cable 4 or USB-JTAG cable).

The Digital I/O has a number of voltage formats such as LVTTTL or LVDS defined by the combination of a jumper setting and the configuration downloaded to the FPGA. In addition it is possible for the HERON-FPGA5 to be used as a choice of RS232, RS485 and Differential ECL serial interfaces.

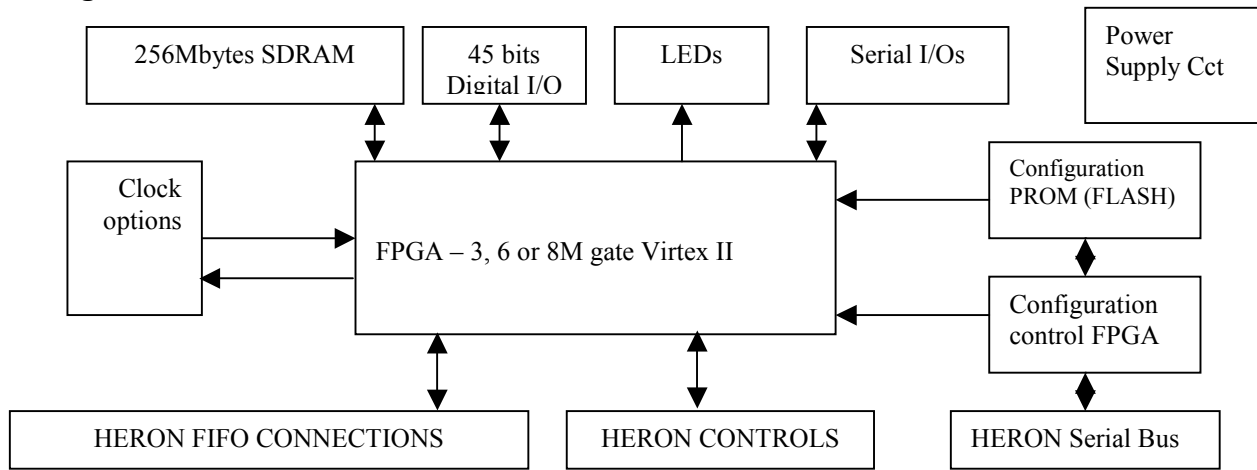

The HERON-FPGA7 can access HERON-FIFOs at a rate of 32 bits per FIFO clock in AND 32 bits per FIFO clock out concurrently. For example with a FIFO clock of 100Mhz this is 400Mbytes/sec in AND 400Mbytes/sec out

The module has a 100Mhz oscillator connected to the FPGA, which can be divided or multiplied using the Digital Clock Managers of the FPGA. Additionally there are sockets where the user can add further Oscillator modules for specialist frequencies or jitter/stability specifications. Of course the digital I/Os and UMIs can be used to provide external clock sources to the FPGA. The use of a Virtex II part allows clock rates of up to 365Mhz to be used internally in the FPGA, but the clock rate that can be used depends on the FPGA design you generate and must be determined using the FPGA development tools.

**“Find your system solution at [www.hunteng.co.uk](http://www.hunteng.co.uk)”**

NOTE VIRTEX II I/Os are not 5v tolerant! Optional 100R series resistors can be fitted to make inputs 5V tolerant.
